

PETROGUARDIAN INSPECTION PROGRAM

Petro Guardian's Omnispection Program is an on-site inspection methodology, using software to record inspection results. A built-in tracking system allows the software to target changes in the lightning protection and static mitigation system. A trigger to site repairs or additions ensures immediate attention so that you know when it is time to update your lightning and static protection systems. With Petro PM integration, the production site is fully protected at all times.

- **Petro Guardian recommends, at a minimum, one inspection per year for each facility equipped with lightning protection systems.**
- **Ensure nothing has been removed, damaged, or corroded since the time of installation.**
- **Each inspection includes an on-site visit using Petro Guardian's Omnispection software to check each component of the lightning protection system based on the site compliance plan.**
- **Ground rod resistance readings are recorded and photographed to make sure the site remains below the required ohm standard.**
- **Each inspection comes with either a pdf report of all compliant and non-compliant issues documented or full access to your system dashboard, which can be used to generate reports and work orders after an inspection has been conducted.**
